SOIL TYPE ACREAGES for ILLINOIS

E. C. A. Runger, L. E. Tyler, and S. G. Carmer¹

This publication reports the estimated acreage of each of the different soil types in Illinois, for the state as a whole and for each county in the state. The data will be useful to individuals working on problems associated with specific soil types and to county and state agencies concerned with agricultural and nonagricultural land use (Extension councils, conservation boards, planning commissions, county supervisors, and others) in their program planning and decision making.

Source and classification of the data

These Illinois data were collected as part of the national Conservation Needs Inventory (CNI) by the Soil Conservation Service in cooperation with the University of Illinois. Nearly 700,000 acres of the Illinois land surface, consisting of 4,500 quarter-sections in a randomized 2-percent sample, were mapped (large metropolitan areas were not included). The mapping was completed in 1962 and the data made available to the University of Illinois by the Soil Conservation Service in 1965 for summary and analysis.

Information collected for the CNI study included soil type, slope class, and erosion or topsoil thickness class. Soil types are listed alphabetically in Table 1 and numerically in Tables 2 and 3. Acreages are reported to the nearest 100 acres.

Slope classes are represented as follows:

- A — 0-2 percent slope
- B — 2-4 percent slope
- C — 4-7 percent slope
- D — 7-12 percent slope
- E — 12-18 percent slope
- F — 18-30 percent slope
- G — greater than 30 percent

Erosion, or topsoil thickness, classes are designated as follows:

- 0 — more than 14 inches of topsoil present
- 1 — 7-14 inches of topsoil present

2 — 3-7 inches of topsoil present

3 — 0-3 inches of topsoil present

Erosion class is designated for each slope class except A. The A slope is always in either the 0 or 1 erosion class.

Statewide acreages of soil types

Total acreage and percentage of each soil type are given in Table 2. Some soil types of minor extent do not appear, either because they were not in the sample mapped or because their acreage was less than 100 acres.

Some soil types occur in many slope and erosion classes, while others have all their acreage within one slope and erosion class. Hosmer silt loam (214) and Fayette silt loam (280) are examples of extensive soil types having acreages in virtually every slope and erosion class, while Drummer silty clay loam (152) and Sable silty clay loam (68) are examples of extensive soil types having acreage in only one slope and erosion class.

County acreages of soil types

For each county in Illinois, the estimated acreage and percentage of each soil type occurring in that county are given in Table 3. The 102 counties are arranged alphabetically in the table.

The number of soil types in a county is not necessarily related to the size of the county. Putnam County, the smallest county in Illinois, has many different soils within its boundaries, while Jefferson County and Warren County, each several times larger than Putnam County, have relatively few different soils within their boundaries.

Limitations of the data

The reader is reminded that the acreages reported in Tables 2 and 3 are *estimates*, based on the mapping of a 2-percent sample. The accuracy of the estimated acreage of each soil type increases as the
